Infection Control Assessment and Response (ICAR) Tool for General Infection Prevention and Control (IPC) Across Settings

Section 3: Observation Form - Transmission-Based Precautions (TBP)

Transmission-Based Precautions (TBP): This form is intended to guide TBP facility (pages 2-5) and healthcare personnel (pages 6-11) observations. This form is intended primarily for use in acute care facilities and long-term care facilities. **Pages 12-16 can be used to conduct a targeted assessment of practices in outpatient healthcare facilities.**

Note: Transmission-Based Precautions should be used in addition to Standard Precautions. Additional information on precautions can be found in Guidelines for Isolation Precautions: Preventing Transmission of Infectious Agents in Healthcare Settings (https://www.cdc.gov/infection-control/hcp/isolation-precautions/index.html)

Transmission-Based Precautions ICAR Interview Questions (Section 2 Module 3) and Observation Forms for other IPC topics (Section 3) are available on the ICAR web page: https://www.cdc.gov/healthcare-associated-infections/php/toolkit/icar.html

Transmission-Based Precautions (TBP) Facility Observations

This section is intended to guide direct observations of how the facility is implementing many of the policies and practices discussed in Section 2 Module 3. If available, observe at least three rooms under TBP and if possible, observe more than one type of TBP being used (e.g., observe one room under Droplet and one under Contact Precautions). However, the reason for performing the ICAR may also inform where observation time is best spent such as focusing on Contact Precautions rooms in the setting of a multidrug-resistant organism outbreak.

Ideally this section is completed by directly observing this information; however, if this is not possible, interviewing healthcare personnel to obtain this information can also be informative. Whether information was collected through direct observation or via interview should be noted during data collection.

For each observed room, select the type(s) of TBP utilized and then select all the listed elements that are present. An unmarked box should indicate that the element was not present. If an element could not be observed or endorsed by interview of healthcare personnel, this should be indicated in the provided notes section.

Transmission-Based Precautions Healthcare Personnel (HCP) Observations

This section is intended to guide direct observations of HCP utilizing the necessary PPE by TBP type. Standard Precautions should always be implemented in addition to Transmission-Based Precautions. For example, if inserting a peripheral IV catheter into a patient on Airborne Precautions, gloves (Standard Precautions) in addition to a respirator (Airborne Precautions) should be used and documented by the ICAR facilitator.

In general, these observations should be conducted covertly (i.e., HCP are not aware they are being observed), and the ICAR facilitator should collect as many observations as feasible across a variety of HCP types and care units. While the ICAR facilitator should aim to observe as many of the listed elements as possible, often times, only partial observations can be made such as only observing a HCP don but not doff PPE. However, this can still provide valuable information on overall IPC practices in a facility.

These observations are largely intended for facilities utilizing conventional PPE practices. More information regarding PPE optimization strategies can be found here: https://www.cdc.gov/niosh/topics/pandemic/conserving.html

In addition, the order of listed donning and doffing practice observations are not intended to suggest a specific donning or doffing sequence. A suggested donning and doffing sequence to include ways to doff PPE while limiting self-contamination can be found at the following link: https://www.cdc.gov/healthcare-associated-infections/media/pdfs/PPE-Sequence-P.pdf

NOTE: This Section is Intended to be Used for a Targeted Assessment Of Practices in Outpatient Healthcare Facilities

Observation of PPE use as part of Standard & Transmission-Based Precautions in Outpatient Settings

Standard Precautions should always be implemented in addition to Transmission-Based Precautions. For example, if inserting a peripheral IV catheter into a patient on Airborne Precautions, gloves (Standard Precautions) in addition to a respirator (Airborne Precautions) should be used and documented by the ICAR facilitator.

Conduct as many observations as possible during visit.

In general, the ICAR facilitator should conduct these observations without notifying the healthcare worker that they are being observed. Ideally all questions are completed but partial observations can still be useful. These observations are intended for facilities utilizing conventional PPE capacity (https://www.cdc.gov/niosh/topics/pandemic/conserving.html).
