Announcement

Clinical Practice Guidelines Published for Treatment of Drug-Susceptible Tuberculosis

The American Thoracic Society, CDC, and the Infectious Diseases Society of America (IDSA) have jointly sponsored the development of guidelines for the treatment of drugsusceptible tuberculosis, which were published by IDSA in *Clinical Infectious Diseases* on August 11, 2016 (*I*) and are available through IDSA (http://www.idsociety.org/Index.aspx) and CDC (http://www.cdc.gov/tb/publications/guidelines/treatment.htm).

Representatives from the American Academy of Pediatrics, Canadian Thoracic Society, International Union Against Tuberculosis and Lung Disease, and World Health Organization also participated in the development of these guidelines, which update American Thoracic Society/CDC/IDSA guidelines published in 2003 (2). The guidelines have been endorsed by the European Respiratory Society and the U.S. National Tuberculosis Controllers Association.

The guidelines provide recommendations for the clinical and public health management of active tuberculosis in settings in which mycobacterial cultures, drug susceptibility testing, and radiographic studies are routinely available. For all

recommendations, literature reviews were performed, followed by assessment of the quality of evidence, using the Grading of Recommendations, Assessment, Development and Evaluation methodology (3).

Given the public health implications of prompt diagnosis and effective management of tuberculosis, empiric multidrug treatment should be initiated in almost all situations in which active tuberculosis is suspected. Clinicians and public health practitioners who care for persons with active tuberculosis should see the full-text online version of the document, which provides detailed discussion of the management of drugsusceptible tuberculosis and recommendations for practice.
