2023 NHSN Surgical Site Infection (SSI) Checklist

Surgical Site Infection (SSI) Documentation Review Checklist

Definition of an NHSN Operative Procedure

An NHSN Operative Procedure is a procedure:

• that is included in the ICD-10-PCS and/or CPT NHSN operative procedure code mapping

Δnd

 takes place during an operation where at least one incision (including laparoscopic approach and cranial Burr holes) is made through the skin or mucous membrane, or entry is through an existing incision (such as an incision from a prior operative procedure)

And

takes place in an operating room (OR), defined as a patient care area that met the Facilities Guidelines
Institute's (FGI) or American Institute of Architects' (AIA) criteria for an operating room when it was
constructed or renovated. This may include an operating room, C-section room, interventional radiology room,
or a cardiac catheterization lab.

		perative Procedure Code(s	·
			·
	DLO, HYST, etc.):	ocedure Category(ies) (CC	ISN Operative Pro

			SIS
			DIP
			DIS
			O/S
cedure of Attributio	Date of Event		

Surgical Site Infection (SSI)			
Superficial incisional SSI (SIP, SIS)			
Element	Element Met	Date	
Must meet the following criteria:			
Date of event occurs within 30 days following the NHSN operative procedure (where day 1 = the			
procedure date)			
AND			
involves only skin and subcutaneous tissue of the incision			
AND Patient has at least <u>one</u> of the following:			
a. purulent drainage from the superficial incision.			
 b. organisms identified from an aseptically-obtained specimen from the superficial incision or subcutaneous tissue by a culture or non-culture based microbiologic testing method, which is performed for purposes of clinical diagnosis or treatment (for example, not Active Surveillance Culture/Testing [ASC/AST]). 			
 c. a superficial incision that is deliberately opened by a surgeon, physician* or physician designee AND 			
culture or non-culture based testing of the superficial incision or subcutaneous tissue is <u>not</u> performed AND			
 patient has <u>at least one</u> of the following signs or symptoms: Localized pain or tenderness Localized swelling Erythema Heat 			
d. diagnosis of a superficial incisional SSI by a physician* or physician designee.			
*The term physician for the purpose of application of the NHSN SSI criteria may be interpreted to n	nean a surg	eon,	

*The term physician for the purpose of application of the NHSN SSI criteria may be interpreted to mean a surgeon, infectious disease physician, emergency physician, other physician on the case, or physician's designee (nurse practitioner or physician's assistant).

Comments:

There are two specific types of superficial incisional SSIs:

- 1. Superficial Incisional Primary (SIP) a superficial incisional SSI that is identified in the primary incision in a patient that has had an operation with one or more incisions (for example, C-section incision or chest incision for CBGB)
- 2. Superficial Incisional Secondary (SIS) a superficial incisional SSI that is identified in the secondary incision in a patient that has had an operation with more than one incision (for example, donor site incision for CBGB)

Note: Refer to SSI Event Reporting Instruction #7 within <u>Chapter 9 Surgical Site Infection [SSI] Event</u> for NHSN operative procedure categories with secondary incision sites available for SSI attribution

Reporting Instructions for Superficial incisional SSI:

The following do not qualify as criteria for meeting the NHSN definition of superficial incisional SSI:

- Diagnosis/treatment of cellulitis (redness/warmth/swelling), by itself, does not meet superficial incisional SSI criterion 'd'.
- A stitch abscess alone (minimal inflammation and discharge confined to the points of suture penetration).
- A localized stab wound or pin site infection; depending on the depth, these infections might be considered either a skin (SKIN) or soft tissue (ST) infection.

<u>Note</u> : For an NHSN operative procedure, a laparoscopic trocar site is considered a surgical incision and not a stab wound. If a surgeon used a laparoscopic trocar site to place a drain at the end of a procedure this is considered a surgical incision.
Comments/Notes:
Comments/Notes.

Surgical Site Infection (SSI)				
Deep incisional SSI (DIP, DIS)				
Element	Element Met	Date		
Must meet the following criteria:				
Date of event occurs within 30 or 90 days following the NHSN operative procedure (where				
day 1 = the procedure date) according to the list in <u>Table 2</u> (see below)				
involves deep soft tissues of the incision (for example, fascial and muscle layers)				
AND Patient has at least <i>one</i> of the following:				
a. purulent drainage from the deep incision.				
b. a deep incision that is deliberately opened or aspirated by a surgeon, physician* or physician designee or spontaneously dehisces AND				
organism(s) identified from the deep soft tissues of the incision by a culture or non-culture based microbiologic testing method which is performed for purposes of clinical diagnosis or treatment (for example, not Active Surveillance Culture/Testing [ASC/AST]) or culture or non-culture based microbiologic testing method is not performed. A culture or non-culture base test from the deep soft tissues of the incision that has a negative finding does not meet this criterion. AND Patient has at least one of the following signs or symptoms: • Fever (>38°C) • Localized pain or tenderness				
c. an abscess or other evidence of infection involving the deep incision detected on gross				
anatomical exam, histopathologic exam, or imaging test.				
*The term physician for the purpose of application of the NHSN SSI criteria may be interpreted to me infectious disease physician, emergency physician, other physician on the case, or physician's design practitioner or physician's assistant).	_	eon,		
 Comments: There are two specific types of deep incisional SSIs: Deep Incisional Primary (DIP) – a deep incisional SSI that is identified in a primary incision in had an operation with one or more incisions (for example, C-section incision or chest incision. Deep Incisional Secondary (DIS) – a deep incisional SSI that is identified in the secondary incision has had an operation with more than one incision (for example, donor site incision for CBGI. Note: Refer to SSI Event Reporting Instruction #7 within Chapter 9 Surgical Site Infection [SSI] Event procedure categories with secondary incision sites available for SSI attribution 	on for CBGB cision in a pa B)) atient that		
Comments/Notes:				

Surgical Site Infection (SSI)		
Organ/Space SSI (O/S)		
Element	Element Met	Date
Must meet the following criteria:		
Date of event occurs within 30 or 90 days following the NHSN operative procedure (where day 1 = the procedure date) according to the list in <u>Table 2</u> (see below)		
AND		
involves any part of the body deeper than the fascial/muscle layers that is opened or manipulated during the operative procedure		
AND Patient has at least <u>one</u> of the following:		
 a. purulent drainage from a drain placed into the organ/space (for example, closed suction drainage system, open drain, T-tube drain, CT-guided drainage). 		
 organism(s) identified from fluid or tissue in the organ/space by a culture or non-culture based microbiologic testing method, which is performed for purposes of clinical diagnosis or treatment (for example, not Active Surveillance Culture/Testing [ASC/AST]). 		
 an abscess or other evidence of infection involving the organ/space detected on gross anatomical exam or histopathologic exam, or imaging test evidence definitive or equivocal for infection. 		
AND		
Meets at least <u>one</u> criterion for a specific organ/space infection site listed in <u>Table 3</u> (see below). These criteria are found in the Surveillance Definitions for Specific Types of Infections (<u>Chapter 17</u>).		
Comments/Notes:		

Table 2. Surveillance Periods for SSI Following Selected NHSN Operative Procedure Categories. Day 1 = the date of the procedure.

30-day Surveillance				
Category	Operative Procedure	Category	Operative Procedure	
AAA	Abdominal aortic aneurysm repair	LAM	Laminectomy	
AMP	Limb amputation	LTP	Liver transplant	
APPY	Appendix surgery NECK Neck surgery			
AVSD	Shunt for dialysis NEPH Kidney surgery			
BILI	Bile duct, liver or pancreatic surgery OVRY Ovarian surgery			
CEA	Carotid endarterectomy PRST Prostate surgery			
CHOL	Gallbladder surgery REC Rectal surgery			
COLO	Colon surgery	SB	Small bowel surgery	
CSEC	Cesarean section	SPLE	Spleen surgery	
GAST	Gastric surgery THOR Thoracic surgery			
HTP	Heart transplant THYR Thyroid and/or parathyroid			
	surgery			
HYST	Abdominal hysterectomy VHYS Vaginal hysterectomy			
KTP	Kidney transplant XLAP Exploratory Laparotomy			
90-day Surveillance				
Category	Operative Procedure			
BRST	Breast surgery			
CARD	Cardiac surgery			
CBGB	Coronary artery bypass graft with both	chest and do	nor site incisions	
CBGC	Coronary artery bypass graft with chest	t incision only	/	
CRAN	Craniotomy			
FUSN	Spinal fusion			
FX	Open reduction of fracture			
HER	Herniorrhaphy			
HPRO	Hip prosthesis			
KPRO	Knee prosthesis			
PACE	Pacemaker surgery			
PVBY	Peripheral vascular bypass surgery			
VSHN	Ventricular shunt			

Notes:

- Superficial incisional SSIs are monitored for a 30-day period for all procedure types.
- Secondary incisional SSIs are monitored for a 30-day period regardless of the surveillance period for the primary site.

Table 3. Specific Sites of an Organ/Space SSI

Category	Specific Site	Category	Specific Site
BONE	Osteomyelitis	MED	Mediastinitis
BRST	Breast abscess or mastitis	MEN	Meningitis or ventriculitis
CARD	Myocarditis or pericarditis	ORAL	Oral cavity infection (mouth, tongue, or gums)
DISC	Disc space infection	OREP	Deep pelvic tissue infection or other infection of the male or female reproductive tract
EAR	Ear, mastoid infection	PJI	Periprosthetic joint infection
EMET	Endometritis	SA	Spinal abscess/infection
ENDO	Endocarditis	SINU	Sinusitis
GIT	Gastrointestinal (GI) tract infection	UR	Upper respiratory tract, pharyngitis, laryngitis, epiglottitis
IAB	Intraabdominal infection, not specified elsewhere	USI	Urinary System Infection
IC	Intracranial infection	VASC	Arterial or venous infection
JNT	Joint or bursa infection	VCUF	Vaginal cuff infection
LUNG	Other infection of the lower respiratory tract		

Notes:

- Criteria for these sites can be found in Chapter 17, <u>Surveillance Definitions for Specific Types of Infections</u>.
- Appendix A found within <u>Chapter 9 Surgical Site Infection [SSI] Event</u> contains a complete list of all NHSN operative procedure categories and the corresponding site-specific SSIs that may be attributable to each category.
